

Rheo-Raman measurements for improved structure-property relationships in crystallizing polymers

Anthony Kotula

June 2018

SEMICRYSTALLINE POLYMERS IN ADDITIVE MANUFACTURING

Customized Parts, Rapid Prototyping

Zopf and Hollister, *N. Engl. J. Med.* (2013)

Selective Laser Sintering

Materials Extrusion

A COMMON PROCESSING PROBLEM: FLOW AND CRYSTALLIZATION

Control: temperature and feed rate

Melt

Cooling & crystallization

Semicrystalline

ST Milner,
Soft Matter,
2011

1 frame per 60 s.

MATERIALS CHARACTERIZATION CHALLENGE

How do we relate flow properties to crystallinity during crystallization?

Rheology

$\frac{\text{Stress}}{\text{Strain}} = \text{Viscoelastic modulus}$

$$\frac{\sigma_{12}(\omega)}{\gamma(\omega)} = G^*(\omega) = G'(\omega) + iG''(\omega)$$

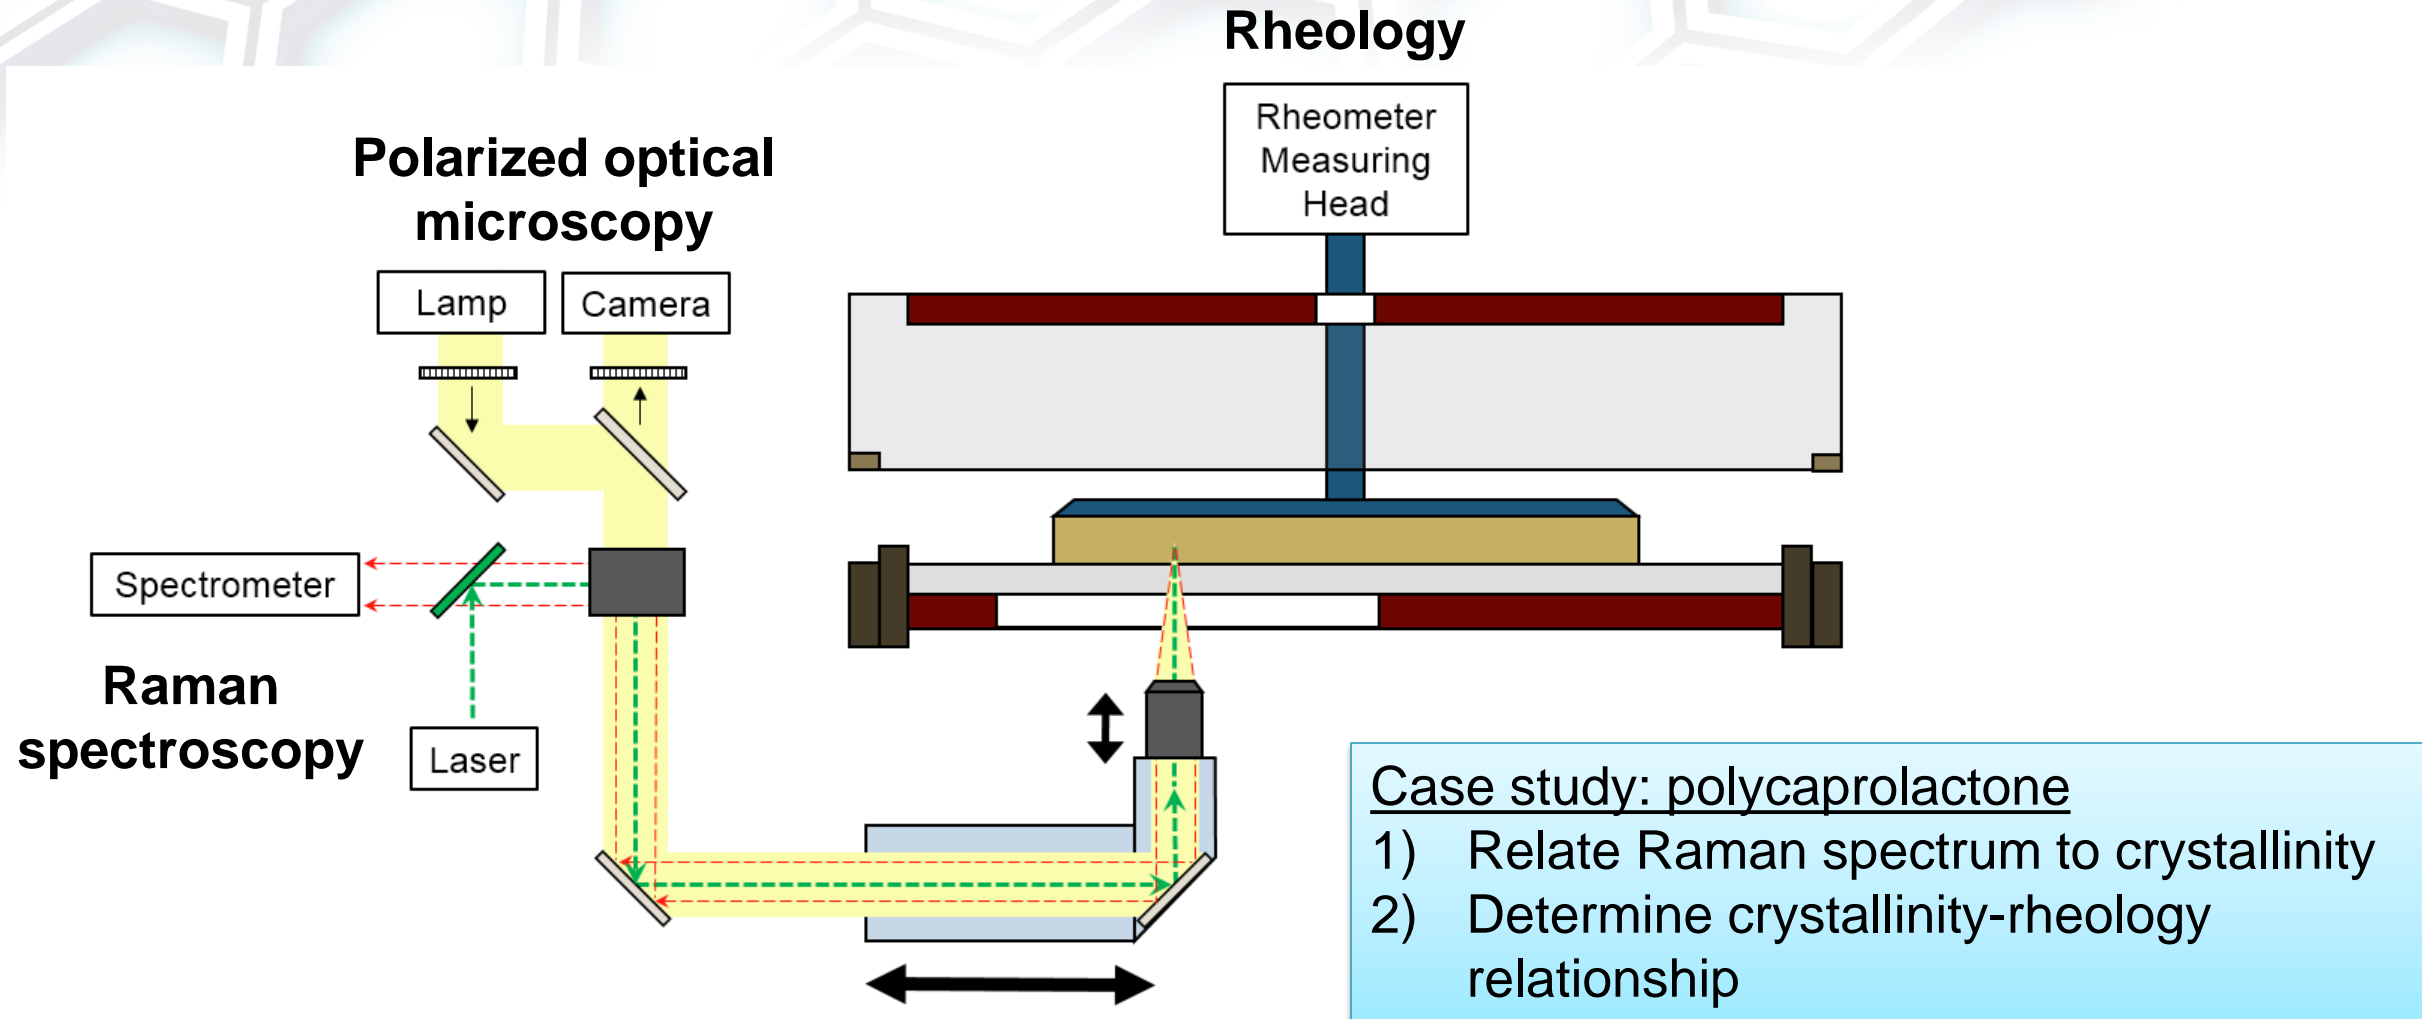

Viscosity, relaxation timescales...

Raman spectroscopy

Covalent bonds, chain conformation...

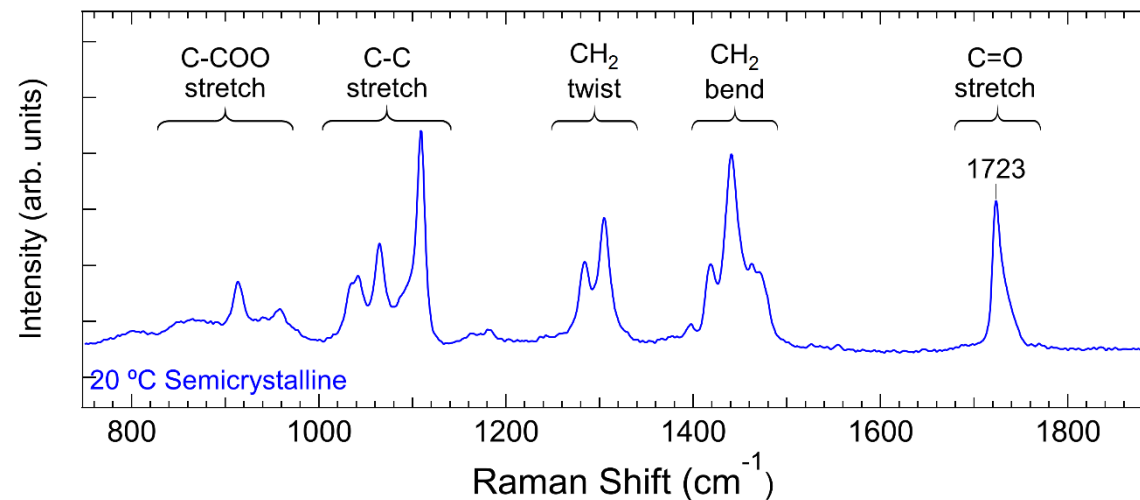

RHEO-RAMAN MICROSCOPY

Kotula, Meyer, De Vito, Plog, Hight Walker, Migler. *Rev. Sci. Inst.* (2016)

REGULAR SINGLE CHAIN VS. CRYSTALLINE EFFECTS IN PCL

Semicrystalline spectrum – both single chain and *interchain* effects

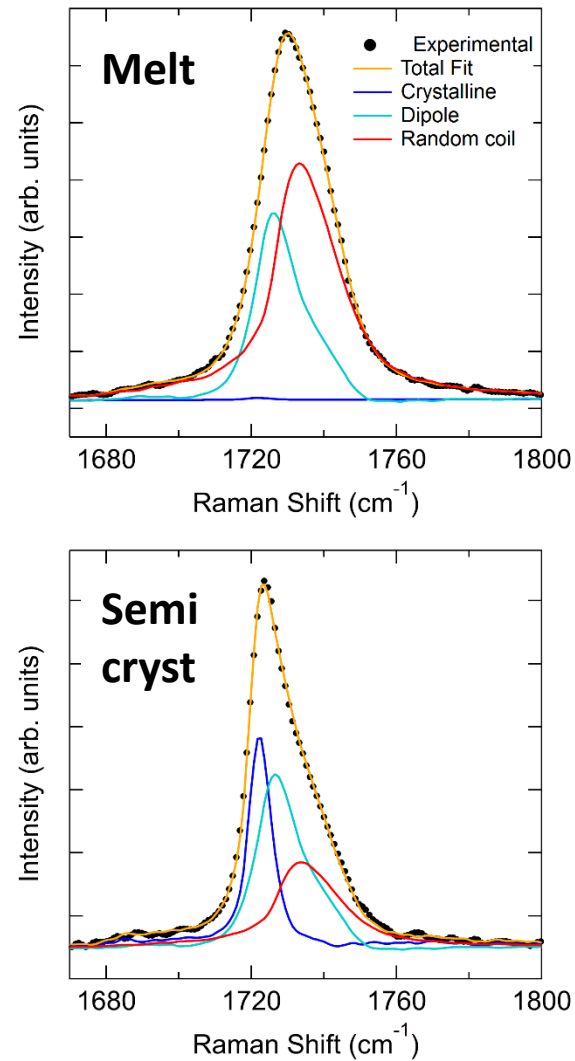

Melt spectrum – many chain conformations, broad features

Need a simple method to find crystalline bands

CHEMOMETRICS TO QUANTIFY CRYSTALLINITY IN C=O STRETCH REGION

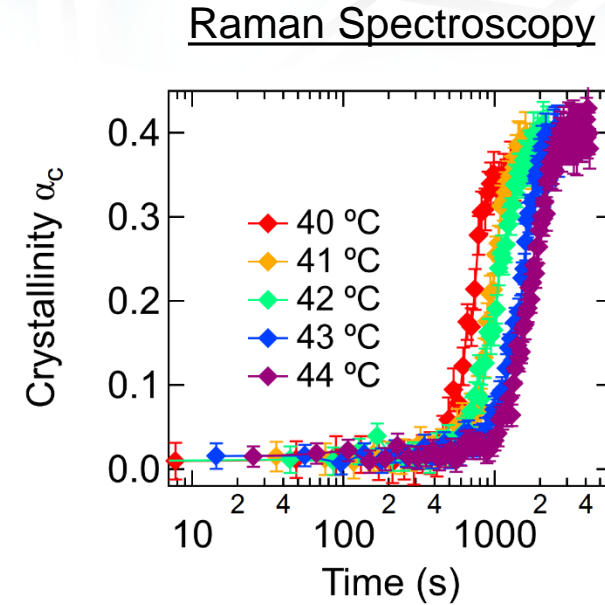

$$\alpha_c = \beta \frac{I_{cr}}{I_{tot}} + C$$

Kotula, Snyder, Migler, *Polymer* (2017)

PCL ISOTHERMAL CRYSTALLIZATION MEASUREMENTS

Simultaneous measurement of
crystallinity and rheology

Kotula and Migler, *J. Rheol.* (2018)

VISCOELASTICITY AS A FUNCTION OF CRYSTALLINITY

Current models do not capture structure development during crystallization

POLYMER CRYSTALLIZATION IS A PERCOLATION PROBLEM

Growth of semicrystalline domains

Dispersed
semicrystalline solids
in a polymer melt

Percolating network of
semicrystalline domains

Dispersed
melt domains in a
semicrystalline solid

Need a modulus dependence on solid fraction that crosses the *percolation threshold*

SUSPENSION-BASED MODEL ACROSS PERCOLATION THRESHOLD

Hard particle
composites
(~Krieger-Dougherty)

$$G = G_0 \left(1 - \frac{\phi}{\phi_c} \right)^{-s}$$

$$s \approx 2$$

Maron & Pierce (1956)

Porous elastic
solids

$$G = G_s \left(\frac{\phi - \phi_c}{1 - \phi_c} \right)^t$$

$$1.6 < t < 2.3$$

Roberts & Garboczi (2002)

SUSPENSION-BASED MODEL ACROSS PERCOLATION THRESHOLD

Hard particle
composites
(~Krieger-Dougherty)

$$G = G_0 \left(1 - \frac{\phi}{\phi_c} \right)^{-s}$$

$$s \approx 2$$

Maron & Pierce (1956)

Porous elastic
solids

$$G = G_s \left(\frac{\phi - \phi_c}{1 - \phi_c} \right)^t$$

$$1.6 < t < 2.3$$

Roberts & Garboczi (2002)

General effective medium theory

$$(1 - \phi) \frac{(G_0)^{1/q} - (G)^{1/q}}{(G_0)^{1/q} + A(G)^{1/q}} + \phi \frac{(G_s)^{1/q} - (G)^{1/q}}{(G_s)^{1/q} + A(G)^{1/q}} = 0$$

Assuming $s = t = q$ $A = \frac{1 - \phi_c}{\phi_c}$

Kotula and Migler, *J. Rheol.* (2018)

MODULUS VS CRYSTALLINITY FOLLOWS EFFECTIVE MEDIUM THEORY

$$(1-\xi) \frac{(G_m^*)^{1/q} - (G^*)^{1/q}}{(G_m^*)^{1/q} + A(G^*)^{1/q}} + \xi \frac{(G_\infty^*)^{1/q} - (G^*)^{1/q}}{(G_\infty^*)^{1/q} + A(G^*)^{1/q}} = 0$$

Kotula and Migler, *J. Rheol.* (2018)

PUTTING EFFECTIVE MEDIUM FIT PARAMETERS IN CONTEXT

Critical percolation fraction

- Monodisperse hard spheres

$$\xi_c = 0.64$$

- Lower percolation fractions
 - **Nonspherical shapes**
 - **Aggregates**

Exponent

- Krieger-Dougherty

$$\eta = \eta_0 \left(1 - \frac{\xi}{\xi_c} \right)^{-s} \quad s = [\eta] \xi_c$$

- **Hard spheres** $s = 1.6$
- **Ellipsoidal** $s \approx 2$

Kotula and Migler, *J. Rheol.* (2018)

CONCLUSIONS

The rheo-Raman microscope provides simultaneous investigation of mechanical, chemical, and structural properties

Simultaneous rheology and Raman reveal that modulus-crystallinity follows generalized effective medium equation
